

IN THE SPECIFICATION:

Please amend paragraph [0041] as follows:

Referring now to Figure 24, the components involved in the deployment of an MSI package are: a packaging studio 401, one or more streaming server(s) 12, and the application manager 110. The packaging studio 401 converts an MSI installation package into a Streaming MSI package. The streaming server 12 deploys the Streaming MSI package to a client 14. The application manager 110 resides on each streaming client 14 and manages the virtual installation, execution and uninstallation of the MSI package on the client. A set of drivers (not shown in Figure 2) perform the internal files and registry control algorithms for the MSI applications during their lifecycle.
